ToxiGenics  
Decatur, Illinois*

The first portion of this introductory textbook and reference deals with toxicology as it applies to the environment. General principles and current concepts of toxicology, metabolism and kinetics are reviewed, and such specific aspects as pulmonary reactions, mutagens, teratogens, carcinogens and environmental immunology are explained. In the remainder of the book, the contributors concentrate on the effect of the regulatory process on environmental quality. The status of air and water standards, innovative perspectives on water pollution monitoring, and the adverse health effects of air pollution are discussed.
